## 3.5 RELACION TEKNIK MBI ZGJIDHJEN KONSTRUKTIVE TE URES HD 2 x 20 m MBI LUMIN DEVOLL, KM 0 +440

### 3..1 Pershkrimi i objektit

Ne kete projekt parashikohet ndertimi i nje ure beton arme qe lidh dy brigjet e lumbit Devoll. Percaktimi i pozicionit per vendosjen e ures, eshte bere ne perputhje me studimin hidrologjik si dhe ate gjologo-inxhinierik. Ura do te kete nje pozicion planimetrik, 90°, me shtratin e lumbit Devoll. Mbistruktura eshte e vendosur horizontalisht duke bere rakordimet perkatese me projektin e rruges. Gjeresia totale e ures eshte 9.0 m, me dy kalime me gjeresi 3.50 m secila. Ura do te kete nje gjatesi prej 2 x 20.0 m si dhe dy trotuar nga 1.0 m secili. Pasqyra e lire ujore eshte 5.0 m duke iu referuar nivelit maksimal te ujrave te ketij lumi.

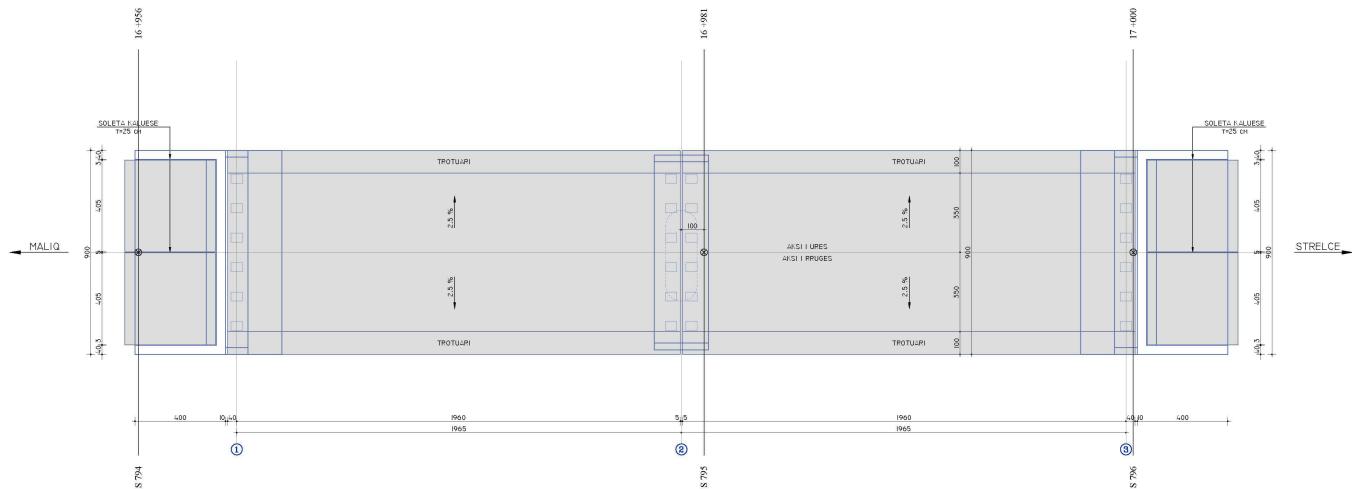

Fig. 1 (Planimetria)

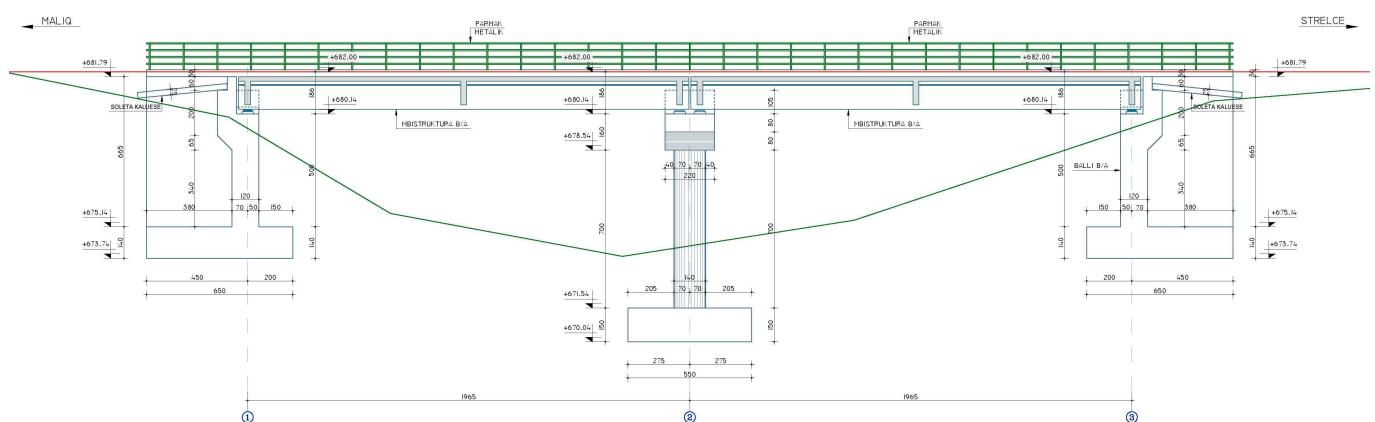

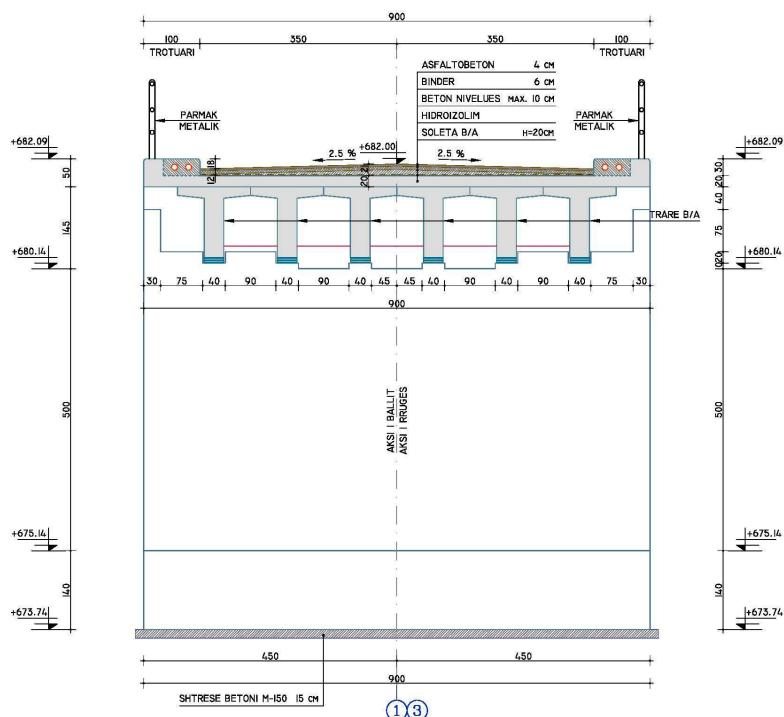

Fig.2 (Prerje gjatesore)

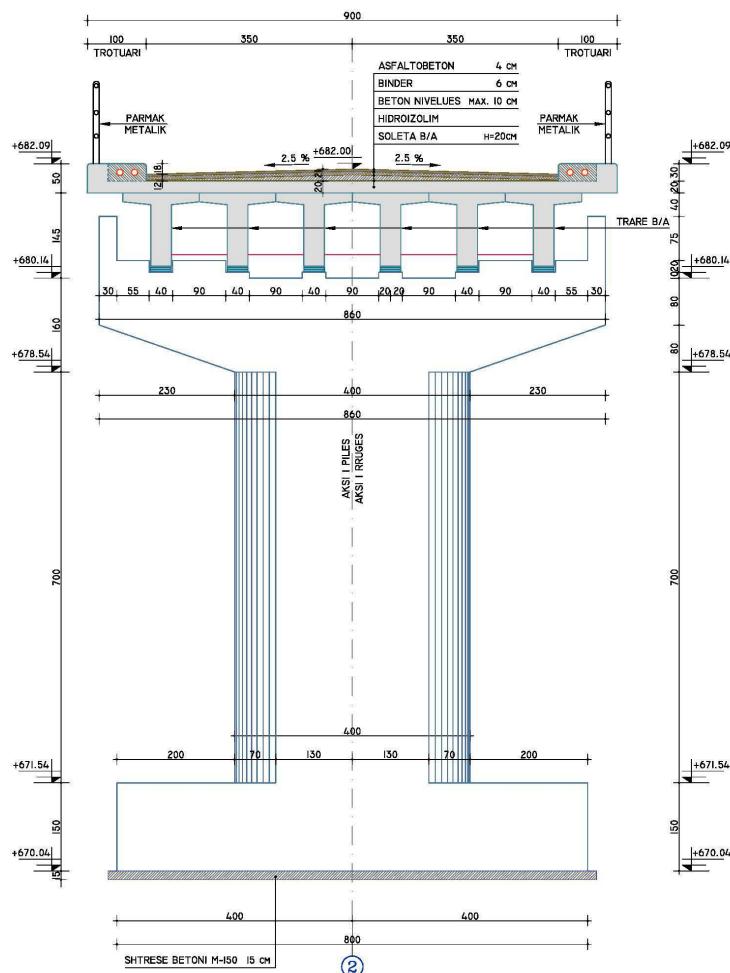

Nenstruktura e ures eshte realizuar me themele te cekta, nisur edhe nga rekomandimet gjeologo-inxhinierike. Themelet mbeshteten mbi shtresen zhavorrore e cila sipas relacionit gjeologjik eshte e pershtatshme per te suportuar ngarkesat qe vijen ne themel.

Mbeshtetjet anesore te ures jane realizuar me anen e ballnave beton arme. Trashesia e murit vertikal te ballnave eshte 120 cm. Nga pas shpatullave jane vendosur soletat rakorduese me trashesi 25cm dhe permasa 4.0 m x 3.5 m ne plan. Per te mbrojtur skrapaten e mbushjes nga pas ballnave, keto te fundit zgjatohen ne formen e mureve beton arme. Ballnat jane realizuar me beton te klasit C25/30 (M-300).

*Fig. 3 (Prerja terthore ne ball)*

Mbeshtetjet e mesit jane te realizuar me ane te nje pile b/a. Pila ka lartesi 7.0m, deri ne nivelin e jastekut. Pilat beton arme ne pjesen e siperme te tyre bashkohen me nje tra (jastek) beton arme i cili ka nje gjeresi 220 cm dhe lartesi qe varion nga 160 cm ne mbeshtetje deri ne 80 cm ne maje.

*Fig. 4 (Prerja terthore ne pile)*

Mbistruktura e ures eshte e parashikuar te ndertohet me trare beton arme te zakonshem C30/37 (M-400). Traret do te kene prerje terthore ne forme “T”. Gjatesia e tyre do te jete 20 m. Ne ure do te vendosen 6 trare. Ne pjesen e siperme te tyre traret monolitizohen me ane te nje solete beton arme me trashesi 20 cm. Ne te dy ekstremet e trareve dhe ne mesin e tyre, jane vendosur diafragma b/a me trashesi 25 cm. Mbeshitetjet e trareve me jastekun e pilave dhe shpatullave do te realizohet me ane te cernierave prej neopreni me permaza 40x30x10.

Ne ure jane parashikuar dy trotuar me gjeresi 1.0 m. Soleta e trotuareve do jete me trashesi 30 cm eshte zgjatim i soletes se ures. Ne brendesi te tyre do te vendosen 2 tuba plastik me diameter Ø110 mm. Ne ane te trotuareve eshte parashikuar te vendoset mbrojtese metalike per kembesore.

Mbi mbeshitetjet e mbistrukture, ne pila dhe ne ballna jane lene hapesira prej 10 cm ku do te vendosen fugat e diletacionit.

Ne ure do te vendoset shtresa asfaltike 4.0 cm, shtresa e binderit 6.0 cm, nje shtrese beton pendance me trashesi maksimale 10 cm ne mesin e ures si dhe hidroizolimi. Gjithashtu ne ure do te vendosen dhe tubat e kullimit te ujrave te shiut.

Per rregullimin e trafikut ne ure eshte parashikuar te vendosen te gjithe elementet e nevojshem te sinjalistikes horizontale dhe vertikale.

### 3..2 Materialet

#### *Betoni C25/30*

• Rezistenca karakteristike kubike	Rck	=	30	N/mm <sup>2</sup>
• Rezistenca karakteristike cilindrike	fck	=	25	N/mm <sup>2</sup>
• Sforcimi mesatar aksial ne terheqje	fctm	=	2.2	N/mm <sup>2</sup>
• Moduli sekant i elasticitetit	E	=	31	kN/mm <sup>2</sup>
• Vlera llogaritese e rezistences ne shtypje	fcd	=	15	N/mm <sup>2</sup>
• Vlera llogaritese e rezistences ne terheqje	ftd	=	1.15	N/mm <sup>2</sup>

#### *Betoni C30/37*

• Rezistenca karakteristike kubike	Rck	=	37	N/mm <sup>2</sup>
• Rezistenca karakteristike cilindrike	fck	=	30	N/mm <sup>2</sup>
• Sforcimi mesatar aksial ne terheqje	fctm	=	2.9	N/mm <sup>2</sup>
• Moduli sekant i elasticitetit	E	=	32	kN/mm <sup>2</sup>
• Vlera llogaritese e rezistences ne shtypje	fcd	=	20	N/mm <sup>2</sup>
• Vlera llogaritese e rezistences ne terheqje	ftd	=	1.3	N/mm <sup>2</sup>

#### *Armatura e çelikut FeB44k ose ekuivalent*

• Rezistenca karakteristike ne terheqje	ftk	=	540	N/mm <sup>2</sup>
• Rezistenca karakteristike e rrjedhshmerise	fyk	=	430	N/mm <sup>2</sup>
• Vlera mesatare e modulit te elasticitetit	Esm	=	210	kN/mm <sup>2</sup>
• Faktori i pjesshem i sigurise	γc	=	1.15	
• Vlera llogaritese e rezistences se rrjedhshmerise	fyd	=	374	N/mm <sup>2</sup>
• Vlera llogaritese e zgjatimit te rrjedhshmerise	esyd	=	0.187%	

### 3..3 Ngarkesat

#### g) Te perhershme

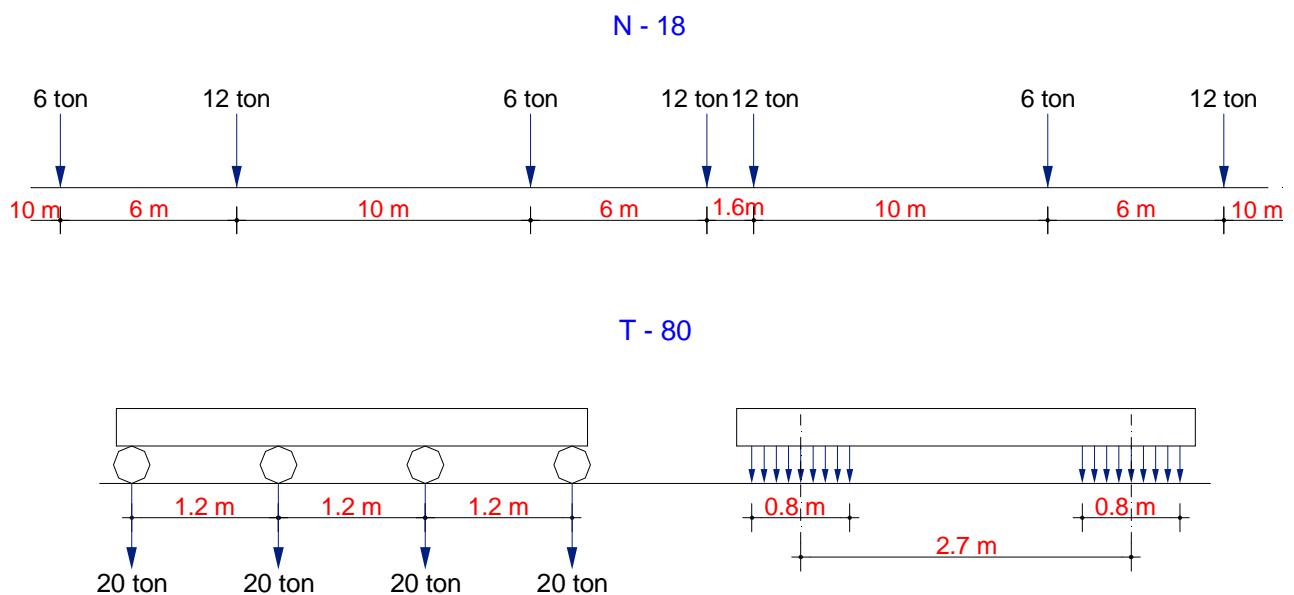

Si ngarkese e perhershme konsiderohet pesha vetjake e elementeve, ngarkesat nga shtresat si dhe presioni i dheut. Pesha vetjake e elementeve llogaritet automatisht nga programi (*Dead load*) ndersa ngarkesa e shtresave te trotuarit dhe rruges si dhe presioni i dheut (mbushjes nga pas ballnave) futen ne program si ngarkese uniformisht e shperndare.

#### h) Te perkohshme

Si ngarkese e perkohshme, konsiderohet ngarkesa e trafikut dhe ngarkesa nga turma. Ngarkesa e trafikut futet ne program si ngarkese (*Moving load*) ndersa ngarkesa nga turma ne trotuar vendoset si ngarkese uniformisht e shperndare (*Live load*). Jane marre ne konsiderate dy tipe skeme ngarkeshash:

##### 5. Ngarkesat sipas KTP

Ngarkesat vertikale normative te levizhshme per llogaritjen e urave ne rruget automobilistike, qe jane marre ne keto llogaritje, perbehen nga dy lloj skemash N-18 dhe T-80. Cdo skeme eshte e perbere nga nje kolone e vazhdueshme automjetesh si ne figuren e meposhtme.

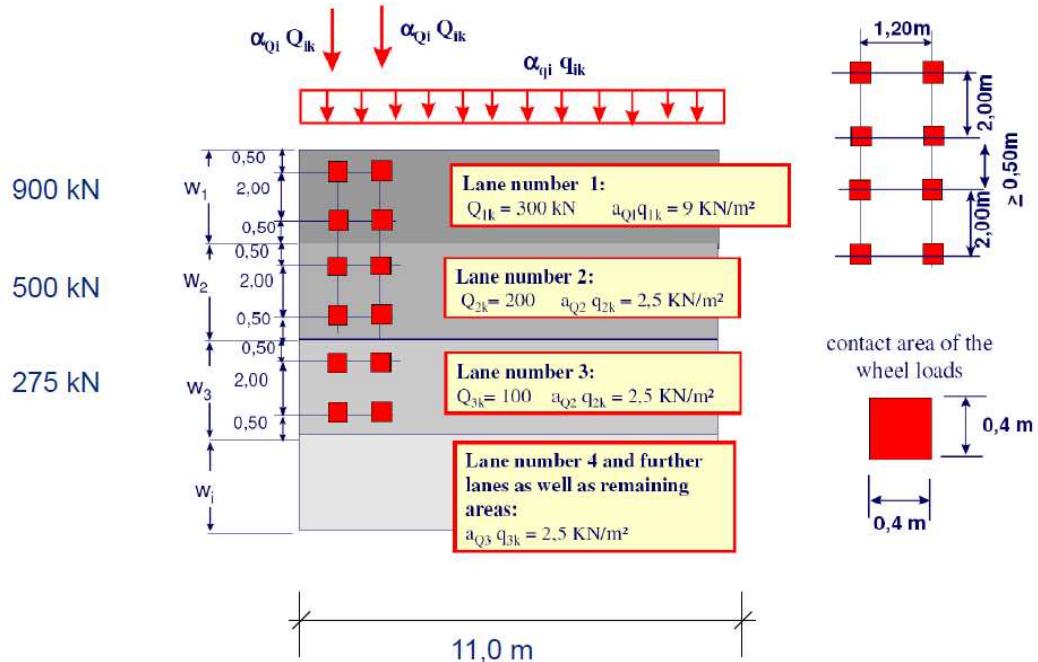

##### 6. Ngarkesat sipas Eurocode

Per percaktimin e efekteve te trafikut rrugor, sipas eurocode, lidhur me verifikimet e gjendjes kufitare limit ULS dhe gjendjes kufitare te sherbimit SLS eshte marre ne konsiderate modelet e meposhtme te ngarkeshave:

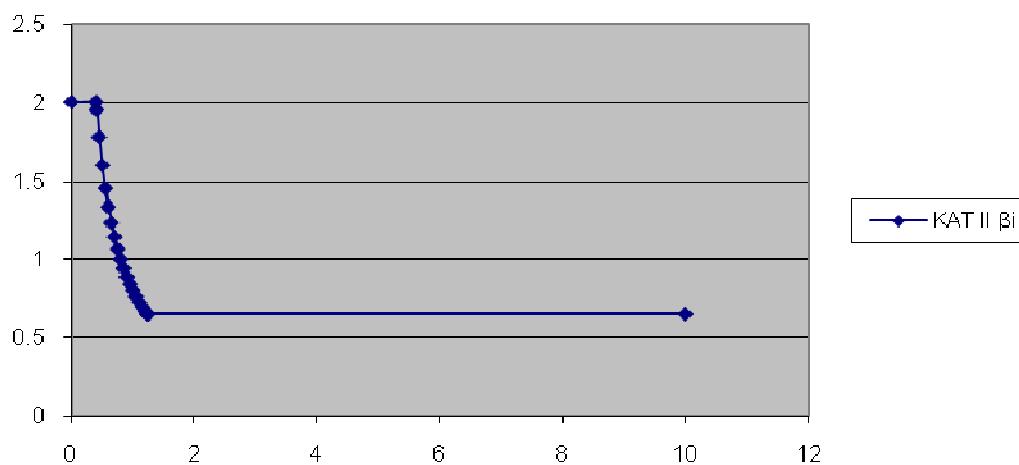

- Modeli 1 i ngarkeses (*LM1*) eshte e perbere nga dy nensisteme ngarkeshash:
  - 1) Nje sistem prej dy ngarkeshash boshti te perqendruara, sipas skices se meposhtme, ku cdo bosht ka peshen  $\alpha_Q Q_k = 300kN$  perfshire dhe amplifikimin dinamik.

- 2) Nje sistem prej ngarkesash te shperndara qe kane nje dendesi peshe  $\alpha_q q_k = 9 \frac{kN}{m^2}$

i) Te vecanta

Reagimi sizmik eshte illogaritur per troje te kategorise II dhe intensitet 8 balle me koeficient sizmik  $k_E = 0.22$ . Ndersa vlerat e koeficientit dinamik  $\beta_i$  merren nga grafiku i meposhtem.

KAT II |  $\beta_i$ 

Grafiku i ndryshimit te koeficientit dinamik  $\beta$  ne funksion te periodes  $T$ .

### 3..4 Kombinimi i ngarkesave

Me poshte po paraqit disa nga kombinimet e perdoruara

*a) Sipas EC*

Kombinimi ULS

$$\text{Comb 1} \quad 1.35 \cdot D + 1.35 \cdot L + 1.5 \cdot (0.75TS + 0.4UDL)$$

$$\text{Comb 5} \quad 1 \cdot D + 0.2 \cdot L + 0.2 \cdot LM1 + 1 \cdot E$$

Kombinimi SLS

$$\text{Comb 7} \quad 1 \cdot D + 1 \cdot L + 1 \cdot LM1$$

$$\text{Comb 8} \quad 1 \cdot D + 1 \cdot L + 1 \cdot N18$$

*b) Sipas KTP*

Kombinimi

$$\text{Comb 9} \quad 1.2 \cdot D + 1.4 \cdot L + 1.4 \cdot N18$$

$$\text{Comb 10} \quad 1.2 \cdot D + 1.1 \cdot T80$$

Ku:

*D – Te gjitha ngarkesat e perhershme (pesha vetjake, shtresat dhe presioni i dheut)*

*E – Ngarkesa sizmike*

*L – Ngarkesa ne trotuar*

*LM1=TS+UDL – Modeli i ngarkeses sipas EC*

### 3..5 Metoda e analizes

Per llogaritjen e ures eshte perdorur programi Sap2000v14.0.0. Ky program bazohet ne metoden e elementeve te fundem. Ura eshte modeluar si nje strukture tredimensionale ku cdo element plan i saj eshte modeluar si element **shell** ndersa elementet njedimensional (kolona, trare dhe pilota) jane modeluar si element **frame**. Ndersa dheu si bazament eshte modeluar nga nje seri sustash te shperndara uniformisht nen themel.

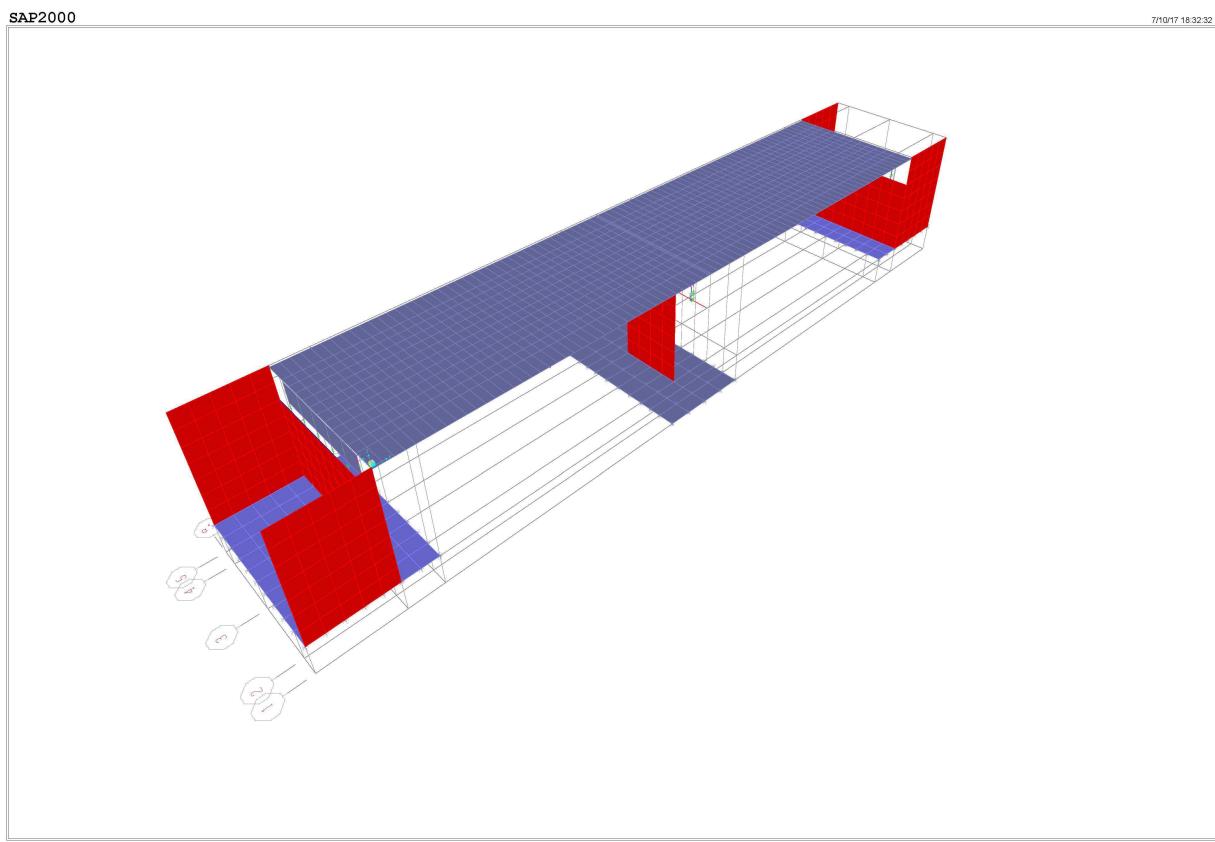

Fig. 4 (Pamja 3D e modelit llogarites)

### 3..7 Rezultate ne forme grafike

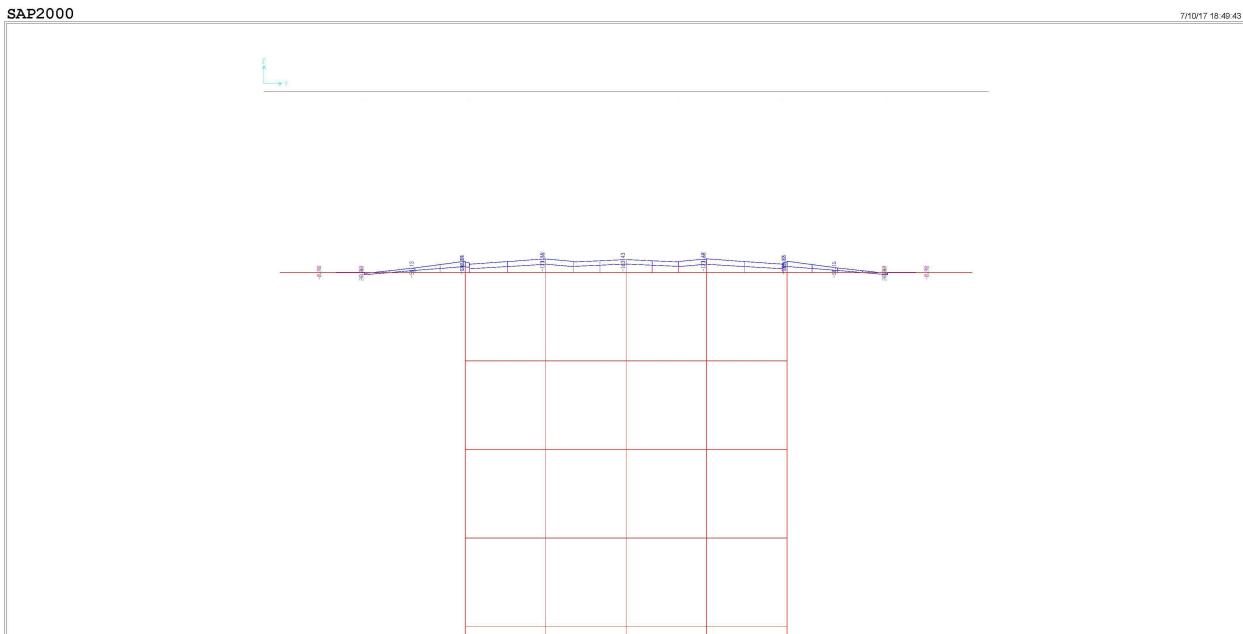

*Epiura e momentit perkules ne jastekun e pilotave per COMB2*

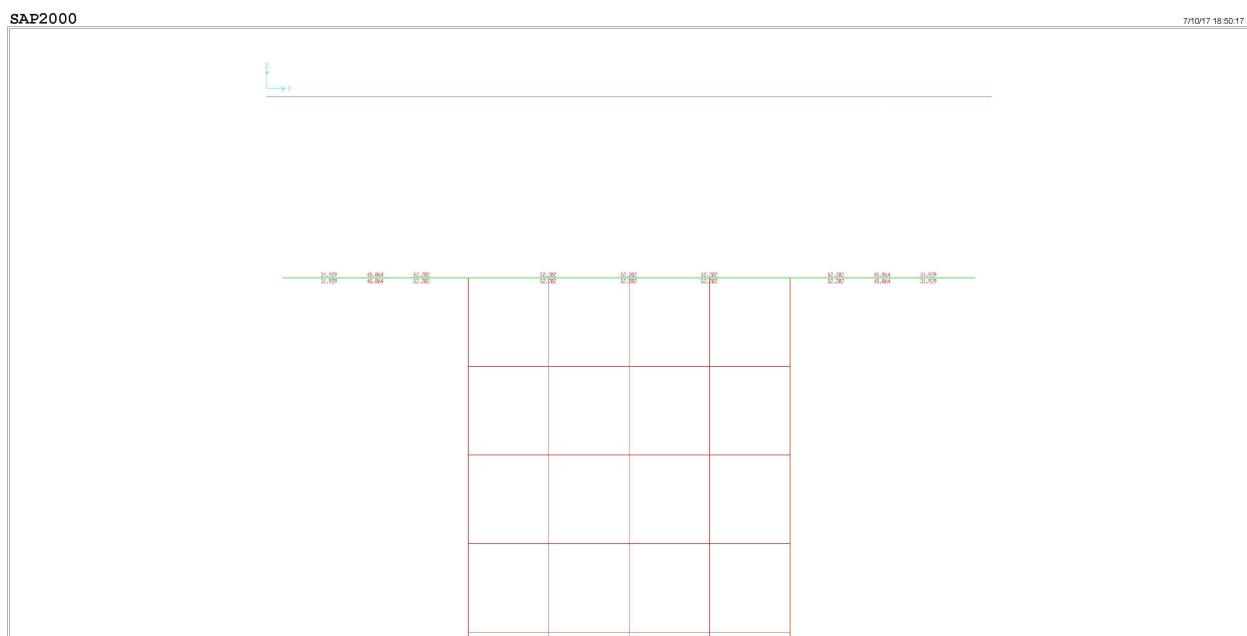

*Epiura e Momentit perkules te Traut T*

### 3..8 Verifikimi i skesionit terthor te jastekut te pilave.

Me poshte paraqitet epiura e momentit perkules per traun e pilave:

*Epiura e momentit M3-3 (Ton.m) per kombinimin ULS (Comb 2)*

*Percaktimi i armatures ne perkulje.*
